

Equipment Status Board

Technician Training

Work the repair queue from the web or from Slack

What's different for you

- You have an **account** — everything members do, **plus** the repair workflow
- Your home base is the **Repair Queue**
- You can do most day-to-day work from **Slack** — claim, set ETA, change status, resolve
- Deeper edits (severity, reassign, multi-field) happen in the **web UI**

Roles: **technician** = repairs + equipment. **staff** = all that + create/edit equipment and admin. Staff inherits every technician ability.

Where the tools work (important for you)

Slack works anywhere. Use it when you're off-site.

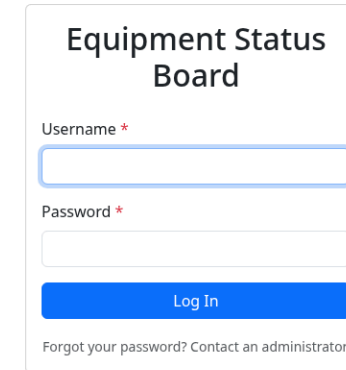

The **web UI and QR pages are on the makerspace network** — reach them **on WiFi, or over VPN** if you have access.

- This is the technician advantage: triage and update repairs **from home via VPN or Slack**
- A QR sticker scanned off-network still won't open unless you're on VPN

Logging in

- Staff create your account; you get a **temporary password** (usually via **Slack DM**)
- Go to the ESB web address → enter **username + password**
- First thing: **Change Password** (top-right nav)
- After login you land on the **Repair Queue**

No self-signup. Forgot your password? A staff member resets it.

The image shows a login form for the 'Equipment Status Board'. It has a title 'Equipment Status Board' at the top. Below the title are two input fields: 'Username *' and 'Password *'. The 'Username' field is highlighted with a blue border. Below the password field is a blue 'Log In' button. At the bottom of the form, there is a link that says 'Forgot your password? Contact an administrator.'

Status & severity — how the colors are computed

✓ Operational

! Degraded

✗ Down

- Equipment status is **derived live** from its **open repair records** — never set by hand
- It reflects the **highest-severity open repair**:

Severity you set	Equipment shows
Down	Down
Degraded	Degraded
Not Sure	Degraded
<i>(no open repairs)</i>	Operational

- Close every open repair and the machine returns to **green** automatically

The Repair Queue

- Default sort: **Down first, then oldest** — top = most urgent
- **Filters:** Area · Status · Assignee (**All / Mine / Unassigned**)
- Click a column to sort; click a row to open the record
- Inline quick actions:
 - **Claim** — on **New** items → assigns you, moves to **Assigned**
 - **Resolve** — opens a note prompt, sets **Resolved**

Filtered URLs are shareable/bookmarkable: `?area=`, `?status=`, `?assignee=me`

The Queue on your phone

- Rows become **stacked cards** — equipment, severity, status, area, age
- Built for **one-handed** use at the workbench
- Same Claim / Resolve actions
- On WiFi or VPN, this is your shop-floor triage view

The Repair Record

- Top: equipment, status, severity, assignee, description
- **Add a Note** — what you found, tried, ordered
- **Upload a diagnostic photo/video**
- **Timeline** below = the **institutional memory**:
 - every status / severity / assignee / ETA change + notes + photos, with who & when

Read the timeline first — don't redo diagnosis someone already did.

Working a repair — the Edit screen

- One **Edit** form changes everything; batch it and **save once**:
 - **Status** · **Severity** · **Assignee** · **ETA** · **Specialist description** · **Duplicate-of**
- Every change writes a **timeline entry** automatically
- Quick paths for the two common actions (no full edit needed):
 - **Claim** → assigns you (and **New** → **Assigned**)
 - **Resolve** → requires a note, sets **Resolved**
- Set an **ETA** on anything waiting — it shows on the dashboard and tells everyone when to expect the tool back

The repair workflow — statuses

Status	Use it when...
New	Just reported, not yet assessed (<i>starting point</i>)
Assigned	You've taken ownership (Claim does this)
In Progress	Actively diagnosing / fixing
Parts Needed	Diagnosed; parts must be sourced
Parts Ordered	Ordered — note order + ETA
Parts Received	In hand, ready to install
Needs Specialist	Beyond current skills/tools — note what's needed
Resolved	Fixed, back in service
Closed – No Issue Found	Couldn't reproduce a problem
Closed – Duplicate	Tracked elsewhere — link the other record

First 7 are "open" (and are the Kanban columns); last 3 are closed and clear the status.

Creating a repair record (web)

- **Equipment page** → **Report Issue** — opens this form with the **equipment pre-selected**
- Or **Repairs** → **New** and pick the equipment
- Required: **Equipment + Description**; optional severity / assignee / safety / consumable
- **Save** → you're taken to the new record

Members' reports land here too, as **New**.

The screenshot shows the 'Create Repair Record' form in a web application. The top navigation bar includes 'ESB', 'Equipment', 'Repairs', and 'Status', with 'Repairs' being the active section. On the right of the navigation bar are links for 'Help', 'Change Password', and 'Logout'. Below the navigation bar, the breadcrumb 'Repairs / Create Repair Record' is visible. The main heading is 'Create Repair Record'. Under 'Required Information', there is a dropdown for 'Equipment *' with 'Shapeoko CNC (Laser / CNC)' selected, and a text area for 'Description *'. Under 'Optional Details', there are dropdowns for 'Severity' (set to '-- Select Severity --') and 'Assignee' (set to '-- Unassigned --'). There are also checkboxes for 'Safety Risk' and 'Consumable Issue', both of which are unchecked. At the bottom of the form are two buttons: 'Create Repair Record' (in blue) and 'Cancel' (in white with a grey border). A footer at the very bottom of the page reads: '© 2026 Jason Antman / Decatur Makers. github.com/DecaturMakers/equipment-status-board MIT licensed.'

Equipment registry & docs

- **Equipment** nav → browse everything, filter by area, **Export CSV**
- Open any item for specs, **manuals, photos, and links**
- Pull up the manual mid-repair from your phone
- If staff enable **technician doc editing**, you can add manuals / photos / links you find

Creating, editing, or archiving equipment itself is staff-only.

ESB	Equipment	Repairs	Status	Help	Change Password	Logout
Equipment Registry						Export CSV
Filter by Area						
All Areas						
Name	Manufacturer	Model	Area			
Bambu X1C	Bambu Lab	X1-Carbon	3D Printing			
Bridgeport Mill	Bridgeport	Series I	Metal Shop			
DeWalt Planer	DeWalt	DW735	Woodshop			
Dust Collector	Jet	DC-1100VX-5M	Woodshop

Prusa MK4 #1	Prusa Research	MK4	3D Printing			
Prusa MK4 #2	Prusa Research	MK4	3D Printing			
Reflow Oven	Puhui	T-962A	Electronics Lab			
Rigol Oscilloscope	Rigol	DS1054Z	Electronics Lab			

Slack — three commands

Command	Who	What
/esb-status	anyone	Check status — all areas, one area, or one machine
/esb-report	anyone	Quick member-style problem report
/esb-repair	tech/staff	Your work command — dispatcher + create record

- Slack maps you to your ESB account by **email**, and re-checks your role at every step
- This is how you stay on top of repairs **off-network**

Slack — **/esb-repair** with no argument (dispatcher)

- Type **/esb-repair** → modal lists **open repairs grouped by area**
- Pick one → **Continue** → choose one **Action**:
 - **Claim (assign to me)** — **New** → **Assigned**, else just sets assignee
 - **Set ETA** — pick a date
 - **Set Status** — In Progress / Closed – Duplicate / Closed – No Issue Found
 - **Resolve with Note** — note required → **Resolved**
- **No repair ID needed** — easiest path for routine in-Slack updates

Slack — `/esb-repair <equipment>` (create)

- Type `/esb-repair Shapeoko` → **create-record modal** opens
- Exact name match → equipment **pre-selected**; otherwise pick from the dropdown
- Fill description, severity, assignee, status → submit

✓ Repair #43 created for **Shapeoko CNC** (Laser / CNC)

An argument always means "create". No argument always means the dispatcher.

Slack — notifications you'll see

Posted to the equipment's **area channel** + cross-posted to **#oops**:

-  new report •  **SAFETY RISK** prefix
-  severity changed •  status changed •  assignee changed
-  ETA set/changed •  resolved / closed •  error

Direct messages are only used to deliver your temporary password. Slash-command replies are private (ephemeral) to you.

When you still need the web UI

Slack covers claim / ETA / status / resolve / create. Use the **web record** for:

- Changing **severity**
- **Reassigning** to someone else
- Setting a **specialist description**
- **Uploading diagnostic photos**
- Editing **several fields at once**

Rule of thumb: quick updates in Slack, detailed work on `/repairs/<id>` in the browser.

Recap — technician cheat sheet

- **Log in** → **Repair Queue**. Change your temp password first.
- **Triage**: Down-first, oldest-first; filter to **Mine** / **Unassigned**
- **Claim** → **work** → **note everything** → **Resolve** (note required)
- Status is **derived** from open repairs; close them and it goes green
- **Slack** **/esb-repair** for off-network claim/ETA/status/resolve
-  Web + QR on **WiFi or VPN**; Slack anywhere
- **Read the timeline** before you start
